

Mishawaka Sewer Overflow Locations

There are 19 locations in Mishawaka’s sewer system where a combination of sewage and stormwater can overflow into the St. Joseph River, as shown on the map below. In an average year, these overflows can occur up to 54 times from one or more overflow locations.

Progress has already been made in reducing overflows. Since 1990, the city has spent \$90 million on wastewater treatment plant improvements and sewer separation projects, which have reduced sewer overflows from an estimated 314 million gallons to 49 million gallons annually. The city’s long-term control plan will reduce overflows even more.

Red dots indicate where raw sewage overflows may occur in wet weather.
